## **Abstract**

The main characteristic of Balkan region in history are permanent migration. Character this migration is changed from period to period (like in Serbia). After WWII in Serbia migrations are had economical character. This migrations are dominated to least decade XX century. According to census 2002 year, in foreign countries have more of 400,000 citizens of Serbia. About 50 percent citizens emigrated in decades before 1990, and next 50 percent emigrated in period 1990-2002. year. This period is characteristic to political, economical and religion migrations. More motives influenced on massive emigration. About 80 percent this emigrations are from central Serbia, and rest are from Vojvodina Province. Intensity emigration in last decade XX century followed importance events. According to dates 2002, large number emigrants were 1992, 1999 and at start 21 century (2001 and 2002). Major emigration from Serbia has been directed towards Central Europe (Austria, Germany, Switzerland). Then the number of emigrants from Serbia is high in France, Italy and Sweden. Inside of Europe emigration from Serbia was in overseas countries, most of emigrants displaced in the USA.

## **Introduction**

Balkan Peninsula has witnessed numerous and constant migrations throughout history. By their nature, those migrations were compulsory or organized. Compulsory movements were caused by political affairs, the economic situation or were result of religious and ethnic reasons. Austria-Hungary monarchy started with the planned migrations in this area. At first, in the middle of the 18 century, the Austrian government was settling Germans in the areas of Bačka, Banat, Srem, Slavonia and Slovenia, and later they settled Hungarians. Finally, following the occupation of this area in 1879, Austria-Hungary was settling various nations in Bosnia. However, a zone with Serbian population was established in the south part of Austria-Hungary, in the area that was named Vojna krajina (Military County). This population sustained because Austria provided certain privileges to the inhabitants within Military County because the border had to be protected. Military County was annexed to Banska Croatia in 1881, and ceased to exist as separate entity.

The arrangement of population in Vojna krajina influenced economic, and later politic, religious, and ethnic migrations when this area was annexed to Croatia in the later period (between the two Wars and after the Second World War).

Migrations were constantly on during Turkish rule in the area of the Balkan Peninsula. Migrations were towards the areas that were liberated from the Ottoman rule. In the beginning of the Turkish rule, a part of population from lowlands and valleys was moving to mountainous regions. Sometime later, the opposite movements happened and that was from higher areas to lower ones, and large-scale migrations were from the southern parts to the north, north-west, and north-east in the boundaries of the Balkan Peninsula. These were 'methanastazistic' movements of population. Dr. Jovan Cvijić studied these migrations thoroughly and he used this term. The whole population was moved from Veleška klisura at Vardar to Zagrebačka gora in the period from 15th century to the beginning of the 20 century. Majority of that population were old Rashas i.e., people of the old Serbian middle-age state. These streams of population were flowing to Serbia for more than four centuries, later to Dalmatia, and they were populating Banat, Bačka, Baranja, Srem and Slavonia, Croatia, Styria, Carniola, they crossed to many islands, to Istria, Trieste environment, and even to Gorica. Some of them reached Abruc in Italy and Erdelj, and southern parts of Russia (Cvijić, 1922). A huge number of their descendants live today in these areas.

Following the Austria-Hungary disintegration in 1918, German population emigrated in huge numbers, leaving empty houses and properties. The whole settlements were relocated to western Bačka, southern Banat, and south-eastern Srem. They were populated by inhabitants, mainly from the mountainous regions of Croatia, Bosnia and Herzegovina, Montenegro, southern Serbia and Macedonia. This process continued even after the Second World War when the number of Germans significantly decreased. According to the 1921 Census, 335910 Germans were living in Vojvodina, and that was 21.9% of the total number of Vojvodina population i.e.,

66.4% of the complete number of Germans in then Yugoslavia. According to the 1948 Census, there were only 29589 persons of German nationality in Vojvodina. Some of them were killed during the war, some of them emigrated, and some of them were in camps (Đurđev, 1995). After the Second World War, more than 215000 emigrants settled in Vojvodina; most of them in Bačka (125684), then in Banat (79465), and only 11162 persons in Srem. In total, more than 216311 people settled in Vojvodina at that time. The majority of immigrants came from Lika, Kordun, Banija, then Bosnian County, Herzegovina, Montenegro, and from the southern part of Serbia, and Macedonia. This process altered the ethnic picture in some parts of Vojvodina. However, this was not the end of big migrations in the area of the ex-Yugoslav republics. At the same time (during the 20th century and in the first half of the 21st century), while migrations were on at the Balkan Peninsula and in the ex-Yugoslavia republics, there were migrations abroad i.e., emigration to European and overseas countries. Economic reasons were the main motive for such migrations in Yugoslavia. By the end of the Second World War, biggest number of immigrants went to overseas countries, and even when the war was over those migrations continued. Those migrations were the result of the economic situation i.e., the situation the country faced at that time. The status of a migrant was extremely difficult and around 200000 of them who in the beginning went to west European countries crossed the ocean and went to the USA (84000), Canada (30,400), Australia (23350), Argentina (15000), Brazil (5000), and New Zealand (560). Those migrations were completed by the end of the 1950s. The amount of migrations to northern and western Europe intensified in the 1960s. These parts of Europe were in need for working class because of their accelerated economic development. According to estimates, there were around 1150000 emigrants who went abroad in this period of the 1960s. During the 1970s, a number of emigrants decreased because there were no new jobs and there was a selection of foreign workers. The number of Yugoslav workers decreased from around 900000 to 650000, but number of family members increased. High-educated personnel (researchers, scientists) were in demand in the 1980s, when the developed world entered the new era of technologic revolution. This was the time when a lot of young and educated people emigrated. In spite of the prohibition of employing foreigners, around 30000 workers on the average from ex-Yugoslavia were employed per year in this decade (Arsenov et al, 1995). Along with emigration and moving from economic underdeveloped areas to the developed inside the country, there were mass migrations from villages to towns. Those streams resulted in depopulating village-settlements and border areas, and that is a specific characteristic of Serbia.

## **Data Material and Method**

In this paper, the data obtained from the Statistical Office of Serbia were used, referring to the citizens of the Republic of Serbia living abroad. The data were specially processed by the country where the citizens went and the year when they left. In addition to these data, it was interesting to analyze the data on the gender and age structure, level of educational attainment of the same citizens. These data were obtained by the additional processing of data from Census 2002. However, it was not possible to get the exact number of people who left the country, so the statistical data of UNHCR and UN were also used. But the world statistics does not offer detailed information on any structure of the citizens who left Serbia, so the data were narrowed to those obtained from the Statistical Office of Serbia. The latest period of emigration is the most interesting one, so it has become the focus of the paper and the data for this period are given by years and for previous periods are given as summaries for each period.

Analytical and comparative methods were mostly used in this paper. Concerning age and gender structure of the population, the mean age of the emigrated population was calculated, as well as major age groups. The analysis of the level of educational attainment of the emigrated population was done with more details to establish the participation of the population with high level of educational attainment and to see if there really existed the 'brain drain' process.

## Emigration from Serbia

The population of the Republic of Serbia in the period 1961- 2002 increased by 18.2%. This growth was more intensive in the first two decades, whereas in the next two decades (from 1981) the population was decreasing to a much smaller extent. In the last period between the Censuses (1991-2002) the population increased only for 70,330 persons even though 600,000 persons came from the territories of the republics of former Yugoslavia (Bubalo, 2000). In addition to the decreased natural population growth and emigration, what other elements had an influence on such a small population growth in the Republic of Serbia? The main reason for this is technical. The population of Kosovo and Metohija boycotted the Census of 1991 so the data for Albanian, Shqiptar and Muslim population could be only roughly estimated. The last Census from 2002 was not conducted in this region. Central Serbia had the same growth fluctuation, which actually represented a decrease in population size, and in the last decade the population size decreased for 14,560 persons despite the immigration of over 400,000 persons. The refugees caused the increase in the population size only in Vojvodina in the last period between the Censuses. But in the period 1981-1991 the population size decreased for 20,893 persons in Vojvodina (Table 1).

Table 1. The population size of the Republic of Serbia, Central Serbia and Vojvodina by Censuses from 1961 - 2002.

Census	the Republic of Serbia		Central Serbia		Vojvodina	
	The population size	Increase or decrease	The population size	Increase or decrease	The population size	Increase or decrease
1961	6,678,247		4,823,276		1,854,971	
1971	7,202,915	524,668	5,250,355	427,079	1,952,560	97,389
1981	7,729,246	526,331	5,694,464	444,109	2,034,782	82,222
1991	7,822,795	93,549	5,808,906	114,442	2,013,889	-20,893
2002	7,893,125	70,330	5,794,346	-14,560	2,098,779	84,890

Source: Statistical Office of Serbia, Comparative population size from 1948 to 2002, book 9, Census 2002, Belgrade.

According to the Census 2002, there were 414,839 persons living abroad. This number comprised 344,151 from Central Serbia, and 70,688 from Vojvodina. More than half of these emigrants moved out in the period 1991-2002 (Table 2). The percentage is slightly smaller than 50% (48,7%) only in Vojvodina. If we analyze data in previous periods between Censuses, we can see that the number of emigrants is becoming smaller, which is logical. Some persons from previous periods have died, moved back to the country or moved to a third country, so it is hard to identify even an approximate number of those who moved out during the 1950s, 1960s and 1970s.

Migrations in all periods between Censuses can be characterized as migrations for economic reasons. However, in the last period they had political, religious and ethnic character. War situation across the territory of the entire former Yugoslavia had an influence on the number of emigrants from Serbia, which is evident in the Census 2002 in the Table 2. The rate of emigration in the last period between Censuses is shown by years, because of its intensity. We can see that the beginning of the war in Slovenia, Croatia and Bosnia and Herzegovina caused the highest rate of emigration to be recorded in 1992. Slightly less than 9% of the total number of emigrants was recorded in the Census 2002. Later on, not even economic sanctions and hard life in Serbia had such a big influence on the increase in the number of emigrants as it was in 1992. However, the bombing campaign of 1999 contributed to the more intensive emigration from Serbia. This year, 21,895 persons left the country and 22,030 persons left the following year. A significantly smaller number of emigrants was recorded in 2001, but the situation in Kosovo and Metohija contributed to the increase in emigration in 2002 (20,027 persons).

Serbia lost a lot, especially during the 1990s. In addition to the destroyed economy, partially devastated country in 1999, it lost a significant proportion of its population. According to Census 2002, around 2 % of the population from Census 1991 moved out of Serbia during 1990s. Around 3% moved out of Central Serbia and 1.7 % moved out of Vojvodina. Who won? The winners were the countries which received those people, because they got experienced and educated work force. They did not have to invest in them, but gained all the benefits.

According to the UNHCR statistics, in 1996, there were 143,559 refugees and asylum-seekers from Serbia and Montenegro in the world. The largest proportion was recorded in Germany (24,773) and Sweden (22, 463). From 1996 to 1999, the number of displaced persons was gradually increasing, so in that year, there were up to 295,696 refugees and asylum-seekers. The bombardment on the territory of Serbia and war uncertainty had an influence on the increase in people from Serbia and Montenegro in the world, especially in Germany, Sweden and Great Britain. From 1999 to 2001, the number of refugees and asylum-seekers decreased again, only to reach its maximum for this period in 2003 (327,204), when there were a lot of refugees from Kosovo and Metohija. In Germany, they represented 53.1% of the total number of refugees and asylum-seekers. A great number went to Sweden, Great Britain and Switzerland, which is much fewer when compared to those who went to Germany. Up to 2005, the number of refugees and asylum-seekers gradually decreased. The reason for a constantly high number of refugees and asylum-seekers from Serbia in the world can be found in the fact that Serbia went through a lot of turmoil in the former Yugoslavia. Since the year 1990, the situation was not war, nor peace, which brought the citizens into a difficult economic situation and forced them to seek better living conditions (Bubalo, Kovacevic, Ivkov, 2010).

In order to analyze the data by direction or regions of emigration, the data from Census 2002 were also used. During the 1990s, three countries were present: Austria, Germany and Switzerland (Table 3). The three aforementioned countries were dominant during the 1980s as well. Over 70% of the emigrants found their homes in those countries. This is certainly a reason why such a large number of people were interested in emigrating to these countries during the 1990s. It is probable that their relatives and friends lived there so they had influenced new emigrants to easily choose these countries for emigration. During the 1970s, more than one third of emigrants went to Germany, over 28% to Austria and around 11% to Switzerland and France.

Source: Statistical Office of Serbia, Census 2002, Additional Data Processing, Belgrade.

In the 1960s, almost 45% of emigrants went to Germany, 16.8% to Austria, 15.9% to France and a significantly smaller number to Switzerland (only 5%). Those who relocated before 1960 mostly emigrated to Germany and France, but some of the population also went overseas ( U.S.A. 13.1%, Australia 10.1% and Canada 6.3%). People went to overseas countries during the 1990s as well, but the proportion was much smaller.

The data on the number of immigrants from Serbia can be found in the statistics in some countries. On the territory of Canada, there were around 63,900 persons who were born on the territories of former Republic of Serbia and Montenegro. On the territory of Australia, according to Census 2001 of the Statistics Bureau, there were 97,135 persons declared as Serbs.

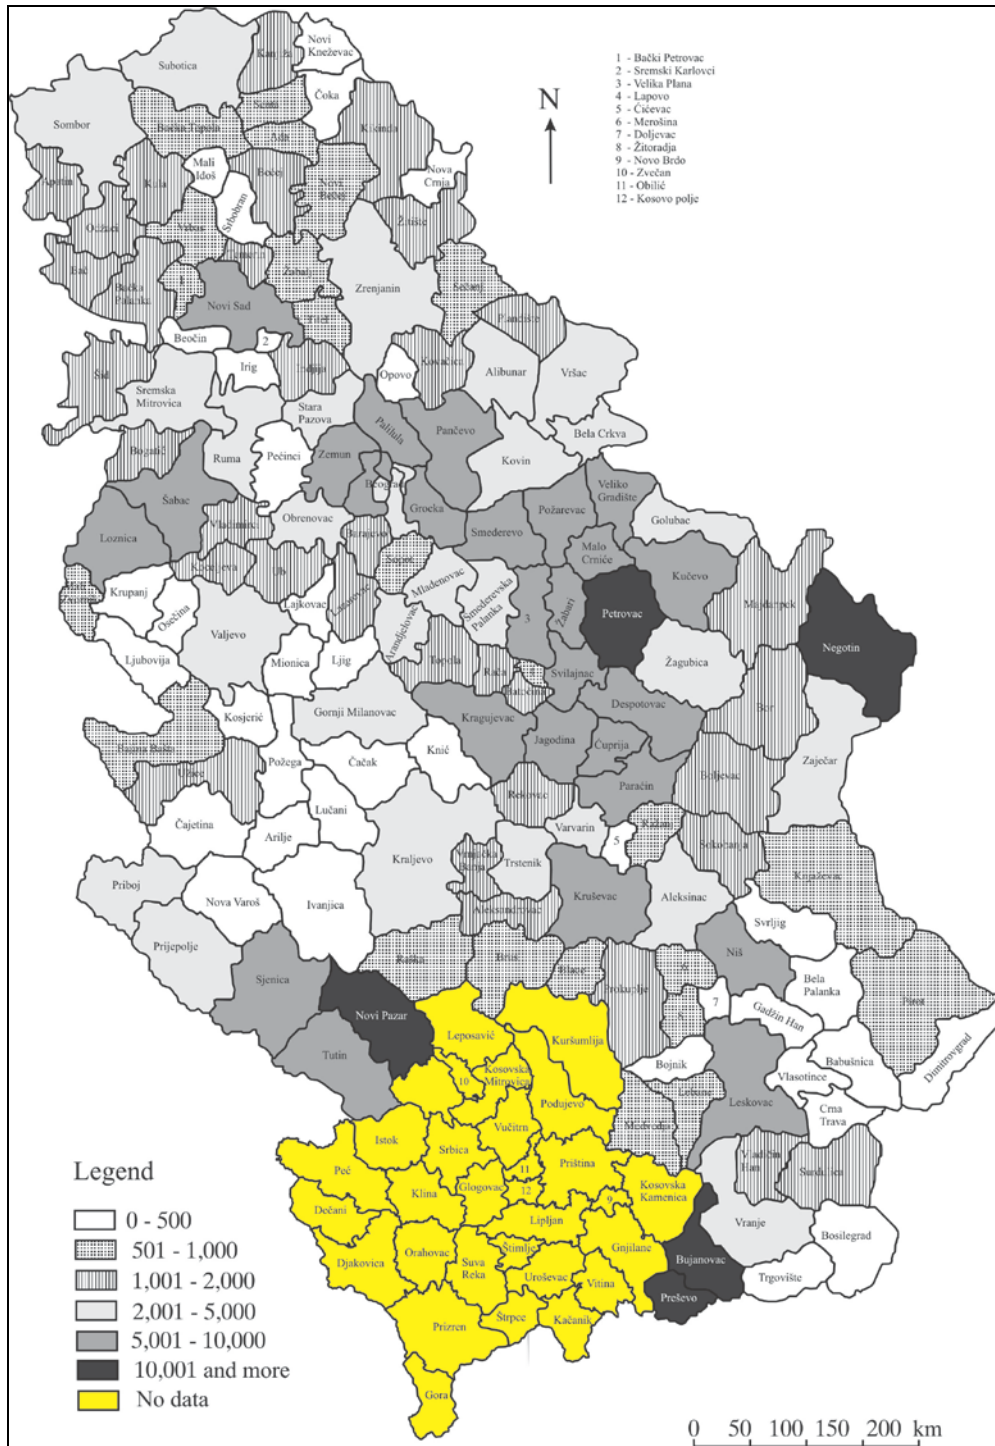

On the territory of Australia and according to the place of birth, in 1947 there were 5,900 people born in the region of former Yugoslavia while that number was 210,000 in 2000. What is noticed is a sudden growth in the period 1991-2000 when the growth was 42,000 persons or 4,200 annually (Djurđjević, Bubalo-Živković, Ivković-Džigurski, Ivanović, 2009).

### *Distribution of emigrants by regions (municipalities)*

The intensity of emigration from certain regions, and from municipalities within the regions, depends on several elements. The first element is the population size. The larger the population size, the bigger opportunities there are for the emigration of larger number of people. The region of Belgrade has the largest population size in Serbia, and almost one fifth of all the emigrants are from Central Serbia (68,150 persons or 19.8% of the total number of emigrants). The largest number of emigrants are from the municipality of Novi Beograd (8,893 persons), and the municipalities of Zemun, Voždovac and Čukarica, with more than 6,000 persons per municipality. The emigrants from Belgrade region mostly emigrated to Germany (20.6%), Austria (11.8%) and the USA (10.8%). The large number of emigrants are from the region of Braničevo - 46,914 persons. From the municipality of Petrovac na Mlavi there are 11,485 emigrants, from the municipality of Požarevac 8,542 people, the municipality of Kučevo 6,267 persons, and over 5,000 from the municipalities of Veliko Gradište, Žabari and Malo Crniće. The closeness of the border and low level of development of the region caused the continuous emigration, mostly to Austria (21,970 persons or 46.8%). Some went to Italy (16.1%) and Switzerland (15.6%). The region of Morava has 9.5% emigrants or 32,823 persons. From the municipalities of Despotovac and Čuprija, there are 7,000 emigrants. The economic reasons had an influence on the intensive emigration from these counties. One third of emigrants went to Switzerland 31.6%, and more than one fifth to Austria (22.2%), to France 18.5% and to Germany 13.8%. The region of Pčinj has 8.3% of emigrants or 28,491 persons. Most of the emigrants are from the municipalities of Preševo (12,991 persons) and Bujanovac (10,380 persons). The most intensive emigration was to Switzerland, more than half of the emigrants (14,492 persons). A large number of emigrants are from the municipalities of Preševo and Bujanovac because of the closeness to Kosovo and constant ethnic and religious clashes. The same reasons caused the large number of emigrants from the region of Raška, 23,822 persons or 6.9%. Most of the emigrants are from the municipalities of Novi Pazar (10,560 persons) and Tutin (6,347 persons). Over 50% of emigrants from the region went to Germany. The region of Bor has more than 25,000 emigrants. This includes almost 15,000 people from Negotin. Most of them emigrated to Austria (47.3%) and Germany 20.8%. The other regions in Central Serbia have a significantly less number of emigrants. The region of Toplice and Pirot have only 3,241 and 1,272 emigrants, respectively.

The largest number of emigrants from Vojvodina are from the region of South Banat – 19,632 persons or 27.8%. Most of the emigrants from the region come from the municipality of Pančevo, with more than 5,000 emigrants. The region of South Bačka has 15,699 emigrants or 22.2% of the total number from Vojvodina. Most emigrants in this region are from Novi Sad, over 7,000. There are about 12,400 persons from the region of Srem or 17.6%. The remaining four regions from Vojvodina have a significantly smaller number of emigrants. Emigrants mostly went to Germany. The regions of North Banat and North Bačka comprise one third of the emigrants who went to Hungary.

Map: The origin of emigrants, by municipalities.

### Age and gender structure of the emigrants

The emigrants from Serbia are mainly male population. The highest number of male population moved out in the period before 1960 and were recorded in Census 2002. Furthermore, in the later periods between the censuses, the male participation in emigration is high (over 53%). Why is it that more men are leaving? This region is still dominated by the patriarchal way of thinking. Insecure economic situation in the country does not provide secure jobs, income is low, credit burden is high. All these elements force young and middle-aged men to go abroad. Moreover, the war situation in the vicinity, the bombardment of 1999, also influenced the decision to leave the country. In this way they could avoid a military draft.

Source: Statistical Office of Serbia, Additional Data Processing, 2002, Belgrade.

In the age structure of male and female population, the age group 25 – 55 is dominant (Graph 1). This means that most of the emigration consists of middle-aged population (Table 5), age group 20-59 (over 63%). One fifth of them are young, up to 20 years of age, and only 5% are in the elderly age group (60+).

The mean age of the population who emigrated from the country is 30, which is ten years younger than the mean age of the population in the Republic of Serbia by Census 2002 (40.2 years of age) (Statistical Office of Serbia).

Since only data from Census 2002 has been analyzed, it is logical that the oldest population who emigrated belongs to the earliest period between censuses – before 1960 (Table 6). The mean age of emigrants who left before 1960 and during the 1960s is 50+, which shows that they left the country as at an early age. This period was dominated by the migrations for economic reasons, although there are cases of political reasons. At the time of socialism and communism, it was not allowed to mention political emigration. During the 1970s, those who emigrated had the mean age of 48 and during the 1980s the mean age was around 35. Based on these data we can see that the emigrants were younger than 20 years of age when they left Serbia. During the last decade of the twentieth century and at the beginning of the twenty-first century, the mean age of emigrants was decreasing from 30 years of age in the beginning to 21.5 years of age in 2001. During the 1990s, when the reasons for emigration were economic, political, religious and ethnic, the young population was leaving Serbia.

Table 6. The mean age of emigrants from Serbia

### **Level of educational attainment**

During the 1960s, most of the emigrants had completed primary or secondary school. During the 1970s and 1980s, the number of emigrants with primary school only increased. Two fifths of all the emigrants had completed primary school only. During the 1990s, there was a decrease in the percentage of emigrants with only primary school, and an increase in those with secondary school, higher school or university degrees. In 1995 and 2000, one tenth of emigrants had a university degree. If observed by figures, more than 2,200 people with university degrees left Serbia in 2000 (Table 7). This was a huge material loss for such a small country. In addition to highly educated people, those without any education, as well as pre-school and primary school children were also leaving, which indicates that the entire families were leaving.

Table 7. Level of educational attainment of emigrants from Serbia

Year of departure	Total	Pre-schoolers and primary school children	Without and education	1-3 grades of primary school	4 grades of primary school	5-7 grades of primary school	Primary school	Secondary school	Higher school	University	Unknown

The emigration of highly educated persons is a process that spread out in all the countries of Central, Eastern and Southern Europe. In the period 1990 – 2000, there was a significant increase in the number of people with university level of education who were emigrating. The highest increase in emigration was recorded in Poland, Romania, Bulgaria, as well as in the countries of former Yugoslavia. In 1990, more than 308,000 persons with university degree left Poland and up to 2000 the figure reached 450,000 persons. In 1990, around 97,000 people left Romania, and in 2000, the figure reached 176,000. In the observed period in Bulgaria, the emigration increased by more than 100% (32,648 persons in 1990, 75,873 persons in 2000). There are no available data for the republics of former Yugoslavia for the year 1990, and in 2000, it was recorded that 148,229 persons emigrated from Serbia, 51,177 from Macedonia, 98,342 from Croatia, and 83,260 from Bosnia and Herzegovina. These are official data from OECD (Breinbauer, 2010). In 2008, 9,648 professors and 8,400 assistant professors emigrated from Albania (Memaj, Qarri, Dollani, 2010).

Emigration of highly educated people has had negative influences on the weak economies of Serbia and other countries of Eastern, Central and Southern Europe.

## Conclusion

Emigration from the territory of Serbia has always been present throughout history. After World War 2, population emigrated for economic reasons. These reasons remained in the later decades, but in the last decade of the twentieth century, political situation in the country and the region contributed to emigration. Most of the emigrants moved out in 1992, after the situation in Bosnia and Herzegovina and in 1999 after the bombardment.

The population emigrated mostly to European countries, Germany, Austria and Switzerland. In the post-war period, France was interesting for Serbian emigrants. They went to France, because it was a friendly country towards Serbia. However, the number of emigrants going to France was decreasing during the 1980s.

People who emigrated from Serbia as relatively young, at the age of thirty, had an impact on the increase participation of the elderly in Serbia and the increase in the mean age of the population. 'Population drain' had such an impact that there people with university degrees participated more in emigration population (8.7%) than those who remained in Serbia (6.2%) in 2002.

When will there be a decrease in emigration from Serbia? This is hard to predict, because emigration continued during the first decade of the twenty first century. Poor economic situation, a large number of firms closing down and the issue of Kosovo with a lot of international tension are all contributing to the insecurity of the region and emigration.
